

Pymaceuticals

Study conducted of 248 unique mice over 45 days tracking the effectiveness of 9 SCC treatments and one Placebo.

- The study was distributed between 51% male and 49% female mice.
- All treatments were measured at least 150 times through out this study.
- Capomulin, Ramicane, Infubinol, Ceftamin we drilled down on more.
- Capomulin and Ramicane appear to be more effective with in the study with lower Mean Tumor Volumes over the 45 days
- Subject weight has an impact on the effectiveness of Capomulin. There is a strong correclation factor of .84 when looking at this weight to tumor volume relationship
